## Unit 36 An introduction to rate of reaction

### 36.1 Rate of reaction (p.2)

- Some chemical reactions happen in an instant: explosion.
- Other reactions take seonds, minutes, hours or even years: rusting or rotting of food.

## 36．1 Rate of reaction（p．2）

－Your pulse rate is the number of times your heart beats every minute．
－You can measure the rate of a reaction by finding the amount of a reactant used up or the amount of a product produced per unit time．
－Chemical kinetics（化學動力學）is the branch of chemistry that measures the rates of chemical reactions，studies the factors that influence the rates，and interprets the results at the molecular level．
－It is important because industrial chemists need to know how fast a reaction goes．They have to find out exactly much oftheir products they can make each henr，day or week．

### 36.2 Measuring the rate of reaction (p.3)

- When magnesium is added to dilute sulphuric acid, they react to give magnesium sulphate and hydrogen:

$$
\mathrm{Mg}(\mathrm{~s})+\mathrm{H}_{2} \mathrm{SO}_{4}(\mathrm{aq}) \rightarrow \mathrm{MgSO}_{4}(\mathrm{aq})+\mathrm{H}_{2}(\mathrm{~g})
$$

- Both magnesium and sulphuric acid get used up in the reaction. At the same time, magnesium sulphate and hydrogen form.

### 36.2 Measuring the rate of reaction (p.3)

- The rate of the reaction can be measured by measuring:
- the amount of magnesium used up per second; or
- the amount of sulphuric acid used up per second; or
- the amount of magnesium sulphate formed per second; or - the amount of hydrogen formed per second.
- For this reaction, it is easier to measure the amount of hydrogen formed per second, since it is the only gas that forms. It can be collected as it bubbles off, and its volume can be measured.

### 36.2 Measuring the rate of reaction (p.3)

- The total volume of gas in the gas syringe is measured every 10 seconds. Suppose excess dilute sulphuric acid is used. The reaction ends when all the magnesium is used up.

### 36.2 Measuring the rate of reaction (p.3)

- Sample data for this experiment are shown.

## Table 36.1 Sample data for the reaction between magnesium and dilute sulphuic acid

| Time (s) | 0 | 10 | 20 | 30 | 40 | 50 | 60 | 70 | 80 | 90 | 100 |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| Total volume of $\mathrm{H}_{2}\left(\mathrm{~cm}^{3}\right)$ | 0.0 | 20.0 | 50.0 | 68.0 | 81.0 | 89.0 | 90.0 | 90.0 | 90.0 | 90.0 | 90.0 |

## 36．2 Measuring the rate of reaction（p．3）

－The reaction finishes at 60 s because no more gas is produced after that．The average rate（平均速率）of reaction during the first 60 s can be worked out as：

Average rate

$$
=\frac{\text { change in volume }}{\text { time }}=\frac{90.0 \mathrm{~cm}^{3}}{60 \mathrm{~s}}
$$

$$
=1.5 \mathrm{~cm}^{3} \mathrm{~s}^{-1}
$$

## 36．2 Measuring the rate of reaction（p．3）

## Instantaneous rate of reaction

－The rate of a reaction at a particular time is called the instantaneous rate（瞬間速率）．Graphically，the instantaneous rate of reaction at a particular time equals the slope of the tangent（切線的斜率）to the curve at that time．
－You can work out the instantaneous rate at 40 s by determining the slope of the tangent to the curve at that time．
change in volume

$$
=(100-53) \mathrm{cm}^{3}
$$

$$
=47 \mathrm{~cm}^{3}
$$

Time (s)

### 36.2 Measuring the rate of reaction (p.3)

- The initial rate (初速) is the instantaneous rate at time $=0 \mathrm{~s}$. You can work this out by determining the slope of the tangent to the curve at time $=0 \mathrm{~s}$.

### 36.2 Measuring the rate of reaction (p.3)

- Although the rate of the above reaction is calculated by using change in volume, rates are most often considered in terms of changing concentrations.
- Rate of reaction is the change in concentration (or amount) of a reactant or a product per unit time.

$$
\text { Rate }=\frac{\text { change in concentration (or amount)of a reactant or a product }}{\text { time }}
$$

### 36.2 Measuring the rate of reaction (p.3)

- Units for rate of reaction are $\mathrm{mol} \mathrm{dm}{ }^{-3} \mathrm{~s}^{-1}, \mathrm{~mol} \mathrm{dm}^{-3} \mathrm{~min}^{-1}$, $\mathrm{mol} \mathrm{s}^{-1}, \mathrm{~cm}^{3} \mathrm{~s}^{-1}$, etc.
- Consider $\mathrm{P}(\mathrm{g}) \rightarrow \mathrm{Q}(\mathrm{g})$ in a closed container.
- The rate at which $P(g)$ is consumed is equal to the rate at which $Q$ is formed.

### 36.2 Measuring the rate of reaction (p.3)

### 36.2 Measuring the rate of reaction (p.3)

- instantaneous rate of consumption of $P(g)$ at 20 s
$=-$ (slope of tangent to curve for $\mathrm{P}(\mathrm{g})$ (in red) at 20 s )
$\left.=-\frac{(-0.180 \mathrm{~mol} \mathrm{dm}}{} \mathrm{m}^{3}\right)\left(20 \mathrm{~s} \quad 0.0090 \mathrm{~mol} \mathrm{dm}^{-3} \mathrm{~s}^{-1}\right.$
- The concentration of reactant $P(g)$ decreases with time. Thus, the change in concentration of $P(g)$ within a given time period is a negative value. As it is usual to work with positive reaction rates, a negative sign is introduced in the above expression so as to make the rate a positive value.
- instantaneous rate of formation of $\mathrm{Q}(\mathrm{g})$ at 20 s
$=$ slope of tangent to curve for $\mathrm{Q}(\mathrm{g})$ (in green) at 20 s

$$
=\frac{0.180 \mathrm{~mol} \mathrm{dm}^{-3}}{20 \mathrm{~s}}=0.0090 \mathrm{~mol} \mathrm{dm}^{-3} \mathrm{~s}^{-1}
$$

### 36.2 Measuring the rate of reaction (p.3)

- Consider $\mathrm{X}_{2}(\mathrm{~g}) \rightarrow 2 \mathrm{X}(\mathrm{g})$ in a closed container.

### 36.2 Measuring the rate of reaction (p.3)

- instantaneous rate of decomposition of $X_{2}(g)$ at 60 s
$=-$ (slope of tangent to curve for $\mathrm{X}_{2}(\mathrm{~g})$ (in red) at 60 s )
$\left.\left.=-\frac{(-0.0375 \mathrm{~mol} \mathrm{dm}}{}{ }^{-3}\right)\right)=5.5 \times 10^{-4} \mathrm{~mol} \mathrm{dm}^{-3} \mathrm{~s}^{-1}$
- instantaneous rate of formation of $\mathrm{X}(\mathrm{g})$ at 60 s
$=$ slope of tangent to curve for $\mathrm{X}(\mathrm{g})$ (in green) at 60 s
$=\frac{0.038 \mathrm{~mol} \mathrm{dm}^{-3}}{35 \mathrm{~s}}=1.1 \times 10^{-3} \mathrm{~mol} \mathrm{dm}^{-3} \mathrm{~s}^{-1}$
- The rate of formation of $X(g)$ is twice the rate of decomposition of $X_{2}(\mathrm{~g})$ because one mole of $X_{2}(\mathrm{~g})$ decomposes to form two moles of $X(\mathrm{~g})$.

### 36.2 Measuring the rate of reaction (p.3)

Practice 36.1
$\mathrm{A}(\mathrm{g})$ decomposes to form $\mathrm{B}(\mathrm{g})$ and $\mathrm{C}(\mathrm{g}) . \mathrm{A}(\mathrm{g})$ is allowed to decompose in a closed container at constant temperature. The graph below shows the variations of concentrations of the three gases in the container with time.

### 36.2 Measuring the rate of reaction (p.3)

a) Write a chemical equation for the reaction. $2 \mathrm{~A}(\mathrm{~g}) \rightarrow \mathrm{B}(\mathrm{g})+3 \mathrm{C}(\mathrm{g})$
b) Determine the average rate of consumption of $A(g)$ in the first 1000 s . average rate of consumption of $\mathrm{A}(\mathrm{g})$ in the first 1000 s
$=-\frac{(-0.3-2.0) \times 10^{-3} \mathrm{~mol} \mathrm{dm}}{} \mathrm{m}^{-3}{ }_{1000 \mathrm{~s}}^{\mathrm{s}}=1.7 \times 10^{-6} \mathrm{~mol} \mathrm{dm}^{-3} \mathrm{~s}^{-1}$
c) Determine the initial rate of formation of $\mathrm{B}(\mathrm{g})$.
initial rate of formation of $\mathrm{B}(\mathrm{g})$
$=\frac{2.25 \times 10^{-3} \mathrm{~mol} \mathrm{dm}^{-3}}{1270 \mathrm{~s}}=1.77 \times 10^{-6} \mathrm{~mol} \mathrm{dm}^{-3} \mathrm{~s}^{-1}$

### 36.2 Measuring the rate of reaction (p.3)

2 Ammonia can react with oxygen according to the equation below:

$$
4 \mathrm{NH}_{3}(\mathrm{~g})+5 \mathrm{O}_{2}(\mathrm{~g}) \rightarrow 4 \mathrm{NO}(\mathrm{~g})+6 \mathrm{H}_{2} \mathrm{O}(\mathrm{~g})
$$

$\mathrm{NH}_{3}(\mathrm{~g})$ and $\mathrm{O}_{2}(\mathrm{~g})$ are allowed to react in a closed container. Find the instantaneous rate of consumption of $\mathrm{O}_{2}(\mathrm{~g})$ if the instantaneous rate of formation of $\mathrm{NO}(\mathrm{g})$ is $1.32 \times 10^{-4} \mathrm{~mol} \mathrm{dm}^{-3} \mathrm{~s}^{-1}$.
instantaneous rate of consumption of $\mathrm{O}_{2}(\mathrm{~g})$
$=\frac{5}{4}\left(1.32 \times 10^{-4}\right) \mathrm{mol} \mathrm{dm}^{-3} \mathrm{~s}^{-1}=1.65 \times 10^{-4} \mathrm{~mol} \mathrm{dm}^{-3} \mathrm{~s}^{-1}$

### 36.3 Methods for following the progress of a reaction (p.10)

- To measure the rate of a reaction, it is necessary to find out how fast one of the products is being formed or how fast one of the reactants is being used up.
- This can be achieved by using a physical method. A physical method depends on a change in physical property during the course of the reaction, such as:
- change in the volume of a gaseous product;
- change in the mass of the reaction mixture;
- change in the pressure of the reaction mixture;
- change in the colour intensity of the reaction mixture.

### 36.4 Following the progress of a reaction by measuring the change in volume of a gaseous product (p.10)

- Consider this reaction:

$$
\mathrm{CaCO}_{3}(\mathrm{~s})+2 \mathrm{HCl}(\mathrm{aq}) \rightarrow \mathrm{CaCl}_{2}(\mathrm{aq})+\mathrm{H}_{2} \mathrm{O}(\mathrm{I})+\mathrm{CO}_{2}(\mathrm{~g})
$$

- One way of following the progress of this reaction is by measuring the volume of carbon dioxide released at regular time intervals.

### 36.4 Following the progress of a reaction by measuring the change in volume of a gaseous product (p.10)

- This arrangement ensures that the two reactants are kept separate while the apparatus is set up so that the start time can be accurately recorded.

Following the progress of a reaction by measuring the
change in volume of a gaseous product

### 36.4 Following the progress of a reaction by measuring the change in volume of a gaseous product (p.10)

- Mix the reactants and start the stopwatch at the same time. Record the volume of carbon dioxide released every 10 seconds until the reaction finishes.

### 36.4 Following the progress of a reaction by measuring the change in volume of a gaseous product (p.10)

Notice:

- The rate of reaction changes during the course of the reaction.
- The slope of the tangent to the curve at time $=0 \mathrm{~s}$ is the steepest. So the initial rate is the highest.
- The slope of the tangent to the curve at time $=40 \mathrm{~s}$ is less steep. So the rate at this point is lower.
- The reaction finishes at 90 s because no more gas is produced after that. When the reaction is over, the curve goes flat.

### 36.4 Following the progress of a reaction by measuring the change in volume of a gaseous product(p.10)

- Suppose excess dilute hydrochloric acid is used, the reaction finishes when all the calcium carbonate is used up.
- Notice that this method can be used to follow the progress of any reaction with one gaseous product.

### 36.5 Following the progress of a reaction by measuring the change in mass of the reaction mixture (p.12)

- An alternative method of following the progress of the reaction between calcium carbonate and dilute hydrochloric acid involves weighing the reaction mixture using the experimental set-up shown:

### 36.5 Following the progress of a reaction by measuring the change in mass of the reaction mixture (p.12)

## Follow the procedure below:

Step 1 Place dilute hydrochloric acid in a conical flask. Stopper the flask with cotton wool.

Step 2 Place the flask on an electronic balance.
Step 3 Remove the cotton wool, drop the calcium carbonate into the flask. Start a stopwatch at the same time. Replace the cotton wool.

Step 4 Record the balance reading every 10 seconds until the reaction finishes.

### 36.5 Following the progress of a reaction by measuring the change in mass of the reaction mixture (p.12)

### 36.5 Following the progress of a reaction by measuring the change in mass of the reaction mixture (p.12)

### 36.5 Following the progress of a reaction by measuring the change in mass of the reaction mixture (p.12)

Practice 36.2
Consider the reaction below:

$$
\begin{array}{r}
\mathrm{CH}_{3}\left(\mathrm{CH}_{2}\right)_{7} \mathrm{CH}=\mathrm{CH}\left(\mathrm{CH}_{2}\right)_{7} \mathrm{COOCH}_{3}(\mathrm{I})+\mathrm{H}_{2}(\mathrm{~g}) \rightarrow \\
\mathrm{CH}_{3}\left(\mathrm{CH}_{2}\right)_{7} \mathrm{CH}_{2} \mathrm{CH}_{2}\left(\mathrm{CH}_{2}\right)_{7} \mathrm{COOCH}_{3}(\mathrm{I})
\end{array}
$$ methyl oleate

At room temperature and pressure, methyl oleate is allowed to react with excess $\mathrm{H}_{2}(\mathrm{~g})$ in the set-up shown below. The $\mathrm{H}_{2}(\mathrm{~g})$ flows from the inverted measuring cylinder to the reacting flask through the tubing.

### 36.5 Following the progress of a reaction by measuring the change in mass of the reaction mixture (p.12)

a) Explain why the right end of the tubing is placed at the uppermost position of the inverted measuring cylinder.

Prevent sucking back of water.

### 36.5 Following the progress of a reaction by measuring the change in mass of the reaction mixture (p.12)

b) The curve below shows the variation of the volume of $\mathrm{H}_{2}(\mathrm{~g})$ in the measuring cylinder with time. (The measuring cylinder initially contains $10.0 \mathrm{~cm}^{3}$ of $\mathrm{H}_{2}(\mathrm{~g})$.)
i) Suggest what would happen to the water level inside the measuring cylinder during the reaction.
The water level rises.
ii) Referring to the curve, which point (A, B or C) represents the most rapid reaction? Explain your answer.
Point A
The tangent to the curve at $A$ is the steepest.

## 36．6 Following the progress of a reaction by measuring the change in pressure（p．15）

－Consider the reaction in a closed container：

$$
\mathrm{Mg}(\mathrm{~s})+2 \mathrm{HCl}(\mathrm{aq}) \rightarrow \mathrm{MgCl}_{2}(\mathrm{aq})+\mathrm{H}_{2}(\mathrm{~g})
$$

－The pressure inside the container will increase as $\mathrm{H}_{2}(\mathrm{~g})$ is formed．
－The progress of the reaction can be followed by measuring the pressure change using a pressure sensor（壓強感應器） connected to a data－logger interface（數據收集儀介面）and a computer．Tilt the beaker containing the acid to mix the reactants．Immediately start recording for 2 minutes．

### 36.6 Following the progress of a reaction by measuring the change in pressure (p.15)

The variation of the pressure inside the closed container with time

### 36.6 Following the progress of a reaction by measuring the change in pressure (p.15)

- The pressure increases as the reaction proceeds. The more the gas formed, the higher is the pressure measured. The pressure no longer changes when the reaction finishes. The curve goes flat.
- The use of a data-logger allows continuous pressure readings. The curve of the variation of pressure with time can be plotted automatically.

## 36．7 Following the progress of a reaction by measuring the change in colour intensity （p．16）

－In acidic solution，propanone and iodine react according to the equation below：
$\mathrm{CH}_{3} \mathrm{COCH}_{3}(\mathrm{aq})+\mathrm{I}_{2}(\mathrm{aq}) \longrightarrow \mathrm{CH}_{3} \mathrm{COCH}_{2} \mathrm{I}(\mathrm{aq})+\mathrm{H}^{+}(\mathrm{aq})+\mathrm{I}^{-}(\mathrm{aq})$ colourless brown

## colourless

－As the reaction proceeds，the brown colour of the reaction mixture becomes less intense as the concentration of iodine decreases．This change in colour intensity allows the progress of the reaction to be followed by using a colorimeter（比色計）．

### 36.7 Following the progress of a reaction by measuring the change in colour intensity (p.16)

- A colorimeter consists of a light source with filters to select a suitable colour of light which is absorbed most by the coloured chemical species in the sample. The light passes through the sample onto a detector.

JK

## 36．7 Following the progress of a reaction by measuring the change in colour intensity （p．16）

－The transmitted light is detected and the absorbance（吸光度） is shown on the meter．The darker the colour of the sample， the higher is the absorbance．

Absorbance $(A)$ is determined by comparing the intensity of the incident light（ $I_{0}$ ）to the intensity of light after it has passed through the sample（ $I_{s}$ ） using the following equation：

$$
A=\log \left(\frac{I_{0}}{I_{\mathrm{s}}}\right)
$$

### 36.7 Following the progress of a reaction by measuring the change in colour intensity (p.16)

- The reaction mixture of propanone and iodine is initially brown, and then fades through orange to yellow to colourless as the iodine is consumed.
- A colorimeter measures the absorbance of the reaction mixture. The absorbance of the reaction mixture decreases as the colour intensity of the reaction mixture and the concentration of iodine decreases.

### 36.7 Following the progress of a reaction by

 measuring the change in colour intensity(p.16)

The absorbance readings can be converted to iodine concentrations by using a calibration graph. You will learn about this in Topic 15 Analytical Chemistry.

Time (s)

### 36.7 Following the progress of a reaction by measuring the change in colour intensity (p.16)

- Notice that this method can be used to follow the progress of a reaction with one coloured reactant or product.

$$
\begin{gathered}
2 \mathrm{MnO}_{4}^{-}(\mathrm{aq}) \\
\text { purple }
\end{gathered}+\underbrace{5 \mathrm{C}_{2} \mathrm{O}_{4}^{2-}(\mathrm{aq})+16 \mathrm{H}^{+}(\mathrm{aq})}_{\text {colourless }} \longrightarrow \underbrace{2 \mathrm{Mn}^{2+}(\mathrm{aq})+10 \mathrm{CO}_{2}(\mathrm{~g})+8 \mathrm{H}_{2} \mathrm{O}(\mathrm{l})}_{\text {colourless }}
$$

- The absorbance of the reaction mixture falls with time as the purple permanganate ions are consumed.

### 36.7 Following the progress of a reaction by measuring the change in colour intensity (p.16) <br> \section*{Practice 36.3}

$\mathrm{Br}_{2}(\mathrm{aq})$ reacts with $\mathrm{HCOOH}(\mathrm{aq})$ according to the equation below:

$$
\mathrm{Br}_{2}(\mathrm{aq})+\mathrm{HCOOH}(\mathrm{aq}) \rightarrow \mathrm{CO}_{2}(\mathrm{~g})+2 \mathrm{HBr}(\mathrm{aq})
$$

a) Suggest TWO physical methods for following the progress of this reaction. Volume of gas formed.
Colour intensity of the reaction mixture
b) For each method suggested in (a), sketch a curve to show how the measured physical parameter would change with time.

J Jing Kung Educational Press All Rights Reserved

### 36.8 Studying the reaction between sodium thiosulphate solution and dilute hydrochloric acid (p.18)

- $\mathrm{Na}_{2} \mathrm{~S}_{2} \mathrm{O}_{3}(\mathrm{aq})+2 \mathrm{HCl}(\mathrm{aq}) \rightarrow 2 \mathrm{NaCl}(\mathrm{aq})+\mathrm{SO}_{2}(\mathrm{aq})+\mathrm{S}(\mathrm{s})+\mathrm{H}_{2} \mathrm{O}(\mathrm{I})$ Sulphur forms and changes the turbidity of the mixture.

Follow the procedure below:
Step 1 Place the sodium thiosulphate solution in a conical flask and put the flask on a cross drawn on a piece of white paper.

Step 2 Quickly add hydrochloric acid to the flask. Start the stopwatch at the same time.

Step 3 Look at the cross from above. The cross grows fainter as the precipitate forms.

Step 4 Stop the stopwatch when the cross becomes invisible. Note the time.

### 36.8 Studying the reaction between sodium thiosulphate solution and dilute hydrochloric acid (p.18)

### 36.8 Studying the reaction between sodium thiosulphate solution and dilute hydrochloric acid (p.18)

- When enough sulphur has formed, the reaction mixture would become so turbid that the cross is obscured.
- Average rate of reaction from start to turbid stage $=\frac{\text { amount of sulphur needed to obscure the cross }}{\text { time to reach this turbid stage }}$
- The shorter the time taken to reach this turbid stage, the faster is the reaction.

## 36．9 Following the progress of a reaction by titimetric analysis（p．20）

－All the methods described so far have not interfered with the progress of the reaction．However，titrimetric analysis （滴定分析）involves taking small samples of the reaction mixture at regular intervals，and stopping the reaction in the sample before analysis，by a process known as quenching （猝滅）．
－You may quench a reaction by：
－cooling the sample in ice rapidly；or
－diluting the sample with a large volume of ice－cold water to lower the temperature and concentrations of the reactants．

### 36.9 Following the progress of a reaction by titimetric analysis (p.20)

- Titrimetric analysis suffers from being a destructive technique, which consumes some of the reaction mixture during the analysis.
- The progress of the below reaction can be followed by monitoring the concentration of NaOH as it is consumed during the course of the reaction:
$\mathrm{CH}_{3} \mathrm{COOCH}_{3}(\mathrm{I})+\mathrm{NaOH}(\mathrm{aq}) \rightarrow \mathrm{CH}_{3} \mathrm{COONa}(\mathrm{aq})+\mathrm{CH}_{3} \mathrm{OH}(\mathrm{aq})$

### 36.9 Following the progress of a reaction by titimetric analysis (p.20)

Follow the procedure below:
Step 1 Take a small sample of known volume from the reaction mixture quickly after the reaction has started.

Step 2 Quench the sample by dilution with a known volume of icecold water and immediately record the time.

Step 3 Repeat Steps 1 and 2 at regular intervals.
Step 4 Determine the concentration of sodium hydroxide remaining in each sample by titrating it with standard hydrochloric acid.

Titrimetric analysis would be suitable for following the progress of a reaction which takes over an hour to go to completion, but mot for one which is over in a few seconds.

### 36.9 Following the progress of a reaction by titimetric analysis (p.20)

### 36.9 Following the progress of a reaction by titimetric analysis (p.20)

## Practice 36.4

1 Why is it better to select a method which avoids sampling for following the progress of a reaction?
Sampling is slow.
It is possible to contaminate the reaction mixture while taking samples.
2 Propanone and iodine react according to the equation below: $\mathrm{CH}_{3} \mathrm{COCH}_{3}(\mathrm{aq})+\mathrm{I}_{2}(\mathrm{aq}) \rightarrow \mathrm{CH}_{3} \mathrm{COCH}_{2} \mathrm{I}(\mathrm{aq})+\mathrm{H}^{+}(\mathrm{aq})+\mathrm{I}^{-}(\mathrm{aq})$
a) Suggest how the reaction could be 'quenched'. Add the sample to excess / large amount of water.
b) Describe how you could follow the progress of the reaction by an acidalkali titration.
Take samples of known volume at regular time intervals.
Quench the reactions.
Titrate each sample with a standard alkali. termine the concentration of hydrogenions in each sample.

## ／Key terms（p．22）

| chemical kinetics | 化學動力學 | pressure sensor | 壓強感應器 |
| :--- | :--- | :--- | :--- |
| average rate | 平均速率 | data－logger <br> interface | 數據收集儀界 <br> 面 |
| instantaneous rate | 瞬間速率 | colorimeter | 比色計 |
| slope of the tangent | 切線的斜率 | absorbance | 吸光度 |
| initial rate | 初速 | titrimetric analysis | 滴定分析 |
| rate of reaction | 反應速率 | quenching | 猝滅 |

## Summary (p.23)

1 Rate of reaction is the change in concentration (or amount) of a reactant or a product per unit time.

Rate $=\frac{\text { change in concentration (or amount)of a reactant or a product }}{\text { time }}$

2 Graphically, the instantaneous rate of a reaction at a particular time equals the slope of the tangent to the concentration-time curve of the reaction at that time.

3 The initial rate of reaction is the instantaneous rate at time $t=0$.

## | Summary (p.23)

4 The following table summarises the methods used to follow the progress of different reactions.

## Method

Example
Measuring the change in volume of a gaseous product

Measuring the change in mass of a reaction mixture

$$
\mathrm{CaCO}_{3}(\mathrm{~s})+2 \mathrm{HCl}(\mathrm{aq}) \longrightarrow \mathrm{CaCl}_{2}(\mathrm{aq})+\mathrm{H}_{2} \mathrm{O}(\mathrm{l})+\mathrm{CO}_{2}(\mathrm{~g})
$$

$$
\mathrm{CaCO}_{3}(\mathrm{~s})+2 \mathrm{HCl}(\mathrm{aq}) \longrightarrow \mathrm{CaCl}_{2}(\mathrm{aq})+\mathrm{H}_{2} \mathrm{O}(\mathrm{l})+\mathrm{CO}_{2}(\mathrm{~g})
$$

Measuring the change in pressure of a reaction mixture

$$
\mathrm{Mg}(\mathrm{~s})+2 \mathrm{HCl}(\mathrm{aq}) \longrightarrow \mathrm{MgCl}_{2}(\mathrm{aq})+\mathrm{H}_{2}(\mathrm{~g})
$$

Measuring the change in colour intensity of a reaction mixture

$$
\mathrm{CH}_{3} \mathrm{COCH}_{3}(\mathrm{aq})+\mathrm{H}_{2}(\mathrm{aq}) \longrightarrow \mathrm{CH}_{3} \mathrm{COCH}_{2}(\mathrm{aq})+\mathrm{H}^{+}(\mathrm{aq})+\Gamma^{( }(\mathrm{aq})
$$

Titrimetric analysis

$$
\mathrm{CH}_{3} \mathrm{COOCH}_{3}(\mathrm{l})+\mathrm{NaOH}(\mathrm{aq}) \longrightarrow \mathrm{CH}_{3} \mathrm{COONa}(\mathrm{aq})+\mathrm{CH}_{3} \mathrm{OH}(\mathrm{aq})
$$

## Unit 36 An introduction to rate of reaction

## Note: Questions are rated according to ascending level of difficulty (from 1 to 5):

```
question targeted at level }3\mathrm{ and above;
gige, question targeted at level 4 and above;

## Unit Exercise (p.24)

## PART I KNOWLEDGE AND UNDERSTANDING

1 Complete the following concept map.

## Unit Exerc ise (p.24)

## PART II MULTIPLE CHOICE QUESTIONS

Directions: Questions 2 and 3 refer to the following methods for following the progress of reactions:

A Colorimetry
B Collecting and measuring the volume of a gas
C Measuring the mass of the reaction mixture
D Quenching, followed by titration with a standard alkali
2 Which method would be the most suitable for following the progress of the reaction below?

Answer: D
$\mathrm{HCOOCH}_{3}(\mathrm{aq})+\mathrm{H}_{2} \mathrm{O}(\mathrm{l}) \rightarrow \mathrm{HCOOH}(\mathrm{aq})+\mathrm{CH}_{3} \mathrm{OH}(\mathrm{aq})$
3 Which method would be the most suitable for following the progress of the reaction below?

Answer: A
$\mathrm{CH}_{3} \mathrm{COCH}_{3}(\mathrm{aq})+\mathrm{I}_{2}(\mathrm{aq}) \rightarrow \mathrm{CH}_{3} \mathrm{COCH}_{2} \mathrm{I}(\mathrm{aq})+\mathrm{H}^{+}(\mathrm{aq})+\mathrm{I}^{-}(\mathrm{aq})$

## Unit 36 An introduction to rate of reaction

4 Which of the following is most likely to have the HIGHEST reaction rate at room temperature?
$\mathrm{ACH}_{4}(\mathrm{~g})+2 \mathrm{O}_{2}(\mathrm{~g}) \rightarrow \mathrm{CO}_{2}(\mathrm{~g})+2 \mathrm{H}_{2} \mathrm{O}(\mathrm{g})$
$\mathrm{B} \mathrm{Ag}^{+}(\mathrm{aq})+\mathrm{Cl}^{-}(\mathrm{aq}) \rightarrow \mathrm{AgCl}(\mathrm{s})$
$\mathrm{C} \mathrm{Pb}(\mathrm{s})+2 \mathrm{HCl}(\mathrm{aq}) \rightarrow \mathrm{PbCl}_{2}(\mathrm{~s})+\mathrm{H}_{2}(\mathrm{~g})$
D $2 \mathrm{H}_{2}(\mathrm{~g})+\mathrm{O}_{2}(\mathrm{~g}) \rightarrow 2 \mathrm{H}_{2} \mathrm{O}(\mathrm{l})$
Answer: B

## Explanation:

$\mathrm{Ag}^{+}(\mathrm{aq})$ ions and $\mathrm{Cl}^{-}(\mathrm{aq})$ ions exist in solution.

## Unit 36 An introduction to rate of reaction

## Unit Exerc ise (p.24)

5 Which of the following could be the units of reaction rate?
$\mathrm{Ag} \mathrm{cm}^{-3}$
B $\mathrm{g} \mathrm{min}^{-1}$
C g mol${ }^{-1}$
D mol dm ${ }^{-3}$

## Answer: B

## Unit Exercise (p.24)

6 Consider the reaction shown below: $2 \mathrm{X}(\mathrm{g}) \rightarrow \mathrm{X}_{2}(\mathrm{~g})$ $\mathrm{X}(\mathrm{g})$ was contained in a gas syringe during the reaction.
Which of the following graphs correctly shows the variation of the numbers of mole of $X(\mathrm{~g})$ and $X_{2}(\mathrm{~g})$ with time during the reaction?

Answer: C

## Unit Exerc ise (p.24)

7 The concentration-time graph for a certain chemical reaction in a closed vessel of fixed volume is shown below.
Which of the following chemical equations correctly represents the reaction?
$A X(g) \rightarrow Y(g)+Z(g)$
$B Y(\mathrm{~g})+\mathrm{Z}(\mathrm{g}) \rightarrow X(\mathrm{~g})$
C $2 \mathrm{X}(\mathrm{g}) \rightarrow 2 \mathrm{Y}(\mathrm{g})+\mathrm{Z}(\mathrm{g})$
D $2 \mathrm{Y}(\mathrm{g})+\mathrm{Z}(\mathrm{g}) \rightarrow 2 \mathrm{X}(\mathrm{g})$

Answer: C

## Unit Exerc ise (p.24)

8 A pressure sensor is used to follow the progress of a certain reaction that occurs in a closed reaction vessel of a fixed volume. The graph shows the results obtained.

Answer: C
Which of the following reactions might the graph represent?
$\mathrm{ACu}(\mathrm{s})+2 \mathrm{AgNO}_{3}(\mathrm{aq}) \rightarrow \mathrm{Cu}\left(\mathrm{NO}_{3}\right)_{2}(\mathrm{aq})+2 \mathrm{Ag}(\mathrm{s})$
$\mathrm{B} \mathrm{H}_{2}(\mathrm{~g})+\mathrm{I}_{2}(\mathrm{~g}) \rightarrow 2 \mathrm{HI}(\mathrm{g})$
$\mathrm{C}_{2} 2 \mathrm{SO}_{3}(\mathrm{~g}) \rightarrow 2 \mathrm{SO}_{2}(\mathrm{~g})+\mathrm{O}_{2}(\mathrm{~g})$
D HCl(aq) $+\mathrm{NaOH}(\mathrm{aq}) \mathrm{NaCl}(\mathrm{aq})+\mathrm{H}_{2} \mathrm{O}(\mathrm{l})$
Explanation:
Two moles of $\mathrm{SO}_{3}(\mathrm{~g})$ decompose to give three moles of gases.
Thus, the pressure in the closed reaction vessel increases.

Time (min)

## Unit Exerc ise (p.24)

9 A student investigated the reaction between magnesium and hydrochloric acid. He measured the volume of gas released every minute. The results he obtained are shown in the graph below.
What was the average rate of reaction between 0 and 100 s?
A $0.44 \mathrm{~cm}^{3} \mathrm{~s}^{-1}$
B $0.35 \mathrm{~cm}^{3} \mathrm{~s}^{-1} \quad$ Answer: B C $0.28 \mathrm{~cm}^{3} \mathrm{~s}^{-1}$
D $0.24 \mathrm{~cm}^{3} \mathrm{~s}^{-1}$
Explanation:
average rate of reaction between
0 and 100 s
$=\frac{35 \mathrm{~cm}^{3}}{100 \mathrm{~s}}=0.35 \mathrm{~cm}^{3} \mathrm{~s}^{-1}$

## Unit Exerc ise (p.24)

10 Consider the reaction below:
$\mathrm{N}_{2}(\mathrm{~g})+3 \mathrm{H}_{2}(\mathrm{~g}) \rightarrow 2 \mathrm{NH}_{3}(\mathrm{~g})$
Suppose the rate of consumption of $\mathrm{H}_{2}(\mathrm{~g})$ is $0.090 \mathrm{~mol} \mathrm{dm}^{-3} \mathrm{~s}^{-1}$. What is the rate of formation of $\mathrm{NH}_{3}(\mathrm{~g})$ ?

Answer: C
A $0.020 \mathrm{~mol} \mathrm{dm}^{-3} \mathrm{~s}^{-1}$
B $0.040 \mathrm{~mol} \mathrm{dm}^{-3} \mathrm{~s}^{-1}$
C $0.060 \mathrm{~mol} \mathrm{dm}^{-3} \mathrm{~s}^{-1}$
D $0.080 \mathrm{~mol} \mathrm{dm}^{-3} \mathrm{~s}^{-1}$
Explanation:
Rate of formation of $\mathrm{NH}_{3}(\mathrm{~g})$
$=\frac{2}{3}(0.090) \mathrm{mol} \mathrm{dm}^{-3} \mathrm{~s}^{-1}=0.060 \mathrm{~mol} \mathrm{dm}^{-3} \mathrm{~s}^{-1}$

## - Unit Exerc ise (p.24)

11 The apparatus below was set up to measure the time taken for $20.0 \mathrm{~cm}^{3}$ of sodium thiosulphate solution to react with $5.0 \mathrm{~cm}^{3}$ of hydrochloric acid in a $100 \mathrm{~cm}^{3}$ conical flask at $20^{\circ} \mathrm{C}$. The timer was started when the sodium thiosulphate solution was added to the acid in the flask. The timer was stopped when it was no longer possible to see the cross on the paper.

## Unit Exerc ise (p.24)

Which of the following is likely to decrease the accuracy of the experiment?
A Rinsing the flask with acid before each new experiment
B Stirring the solution throughout each experiment
C Using the same piece of paper for each experiment
D Using different measuring cylinders to measure the volumes of acid and sodium thiosulphate
(AQA Advanced Subsidiary, Paper 2, 7404/2, Specimen v0.5, 2015, 21) Answer: A

## Unit Exerc ise (p.24)

12 The apparatus shown can be used to follow the progress of some chemical reactions. For which of the following reactions would the apparatus be suitable?
(1) $2 \mathrm{H}_{2} \mathrm{O}_{2}(\mathrm{aq}) \rightarrow 2 \mathrm{H}_{2} \mathrm{O}(\mathrm{l})+\mathrm{O}_{2}(\mathrm{~g})$
(2) $\mathrm{MgO}(\mathrm{s})+2 \mathrm{HCl}(\mathrm{aq}) \rightarrow \mathrm{MgCl}_{2}(\mathrm{aq})+\mathrm{H}_{2} \mathrm{O}$ (l)
(3) $\mathrm{ZnCO}_{3}(\mathrm{~s})+2 \mathrm{HCl}(\mathrm{aq}) \rightarrow \mathrm{ZnCl}_{2}(\mathrm{aq})+\mathrm{CO}_{2}(\mathrm{~g})+\mathrm{H}_{2} \mathrm{O}(\mathrm{l})$

A (1) and (2) only
B (1) and (3) only
C (2) and (3) only
D (1), (2) and (3)

## Explanation:

(2) NO gas is produced in this reaction.

Answer: B gas syringe

## Unit Exercise (p.24)

13 Consider the reaction between permanganate ions and ethanedioate ions.
8)

$$
\begin{aligned}
& 2 \mathrm{MnO}_{4}^{-}(\mathrm{aq})+5 \mathrm{C}_{2} \mathrm{O}_{4}{ }^{2-}(\mathrm{aq})+16 \mathrm{H}^{+}(\mathrm{aq}) \\
& \rightarrow 2 \mathrm{Mn}^{2+}(\mathrm{aq})+10 \mathrm{CO}_{2}(\mathrm{~g})+8 \mathrm{H}_{2} \mathrm{O}(\mathrm{I})
\end{aligned}
$$

Which of the following methods can be used to follow the progress of the reaction?
(1) Measuring the colour intensity of the reaction mixture
(2) Weighing the mass of the reaction mixture
(3) Measuring the pH of the reaction mixture

Answer: D

A (1) and (2) only
B (1) and (3) only
C (2) and (3) only
D (1), (2) and (3)

Explanation:
(2) The mass of the reaction mixture decreases as carbon dioxide gas is released in the reaction.
(3) The pH of the reaction mixture increases as $\mathrm{H}^{+}(\mathrm{aq})$ ions are consumed in the reaction.

## Unit Exercise (p.24) PART III STRUCTURED QUESTIONS

14 For each of the following reactions, suggest with reason(s) ONE method that can be used to follow the progress of the reaction.
a) $\mathrm{Zn}(\mathrm{s})+\mathrm{CuSO}_{4}(\mathrm{aq}) \rightarrow \mathrm{ZnSO}_{4}(\mathrm{aq})+\mathrm{Cu}(\mathrm{s})$

Colorimetry (1)
because the blue colour of $\mathrm{CuSO}_{4}(\mathrm{aq})$ decreases as the reaction proceeds. (1)
b) $2 \mathrm{NaOCl}(\mathrm{aq}) \rightarrow 2 \mathrm{NaCl}(\mathrm{aq})+\mathrm{O}_{2}(\mathrm{~g})$

Any one of the following:

- Measure the volume of oxygen gas collected (1) because oxygen gas is produced as the reaction proceeds. (1)
- Measure the pressure of the reaction mixture in a closed vessel (1) because oxygen gas is produced and the pressure increases as the reaction proceeds. (1)
- Measure the mass of the reaction mixture (1) because oxygen gas produced escapes as the reaction proceeds. (1)

## Unit Exerc ise (p.24)

c) $2 \mathrm{NO}(\mathrm{g})+\mathrm{O}_{2}(\mathrm{~g}) \rightarrow 2 \mathrm{NO}_{2}(\mathrm{~g})$

Any one of the following:

- Measure the pressure of the reaction mixture in a closed vessel (1) because 3 moles of gas react to give 2 moles of gas, and the pressure decreases as the reaction proceeds. (1)
- Measure the brown colour intensity of the reaction mixture (1)

## Unit 36 An introduction to rate of reaction

## Unit Exercise (p.24)

15 Zinc reacts with dilute sulphuric acid to form hydrogen gas. The progress of the reaction is followed by monitoring how the volume of gas released changes with time.
a) Draw an experimental set-up for monitoring the progress of the reaction.

(2)

JK Jing Kung Educational Press All Rights Reserved

## Unit Exerc ise (p.24)

b) The curve below shows how the volume of hydrogen released changes with time.

i) State the meaning of the term 'rate of reaction.

Any one of the following:

- Change in concentration of a reactant / product per unit time (1)
- Amount of a substance formed / consumed per unit time (1)
ii) Describe how the rate of formation of hydrogen changes with time.

The initial rate is the highest. (1)
e rate decreases with time and becomes zero when

## Unit Exercise (p.24)

16 In an experiment, gas $X$ reacted completely with solid $Y$ to form gas $Z$ as
ghown in the equation below: $2 \mathrm{X}(\mathrm{g})+\mathrm{Y}(\mathrm{s}) \rightarrow \mathrm{Z}(\mathrm{g})$
The graph below shows how the concentration of $Z$ varied with time at constant temperature. ( $\mathrm{X}, \mathrm{Y}$ and Z do NOT represent symbols of elements.)

## Unit Exerc ise (p.24)

a) Calculate the average rate of formation of $Z(\mathrm{~g})$ in the first 10 minutes. Average rate of formation of $Z(\mathrm{~g})$ in the first 10 minutes

$$
\begin{equation*}
=\frac{0.38 \mathrm{~mol} \mathrm{dm}^{-3}}{10 \mathrm{~min}^{2}}=0.038 \mathrm{~mol} \mathrm{dm}^{-3} \mathrm{~min}^{-1} \tag{1}
\end{equation*}
$$

b) Base on the answer in (a), deduce the average rate of consumption of $X(g)$ in the first 10 minutes.

According to the equation, 2 moles of $\mathrm{X}(\mathrm{g})$ react with $\mathrm{Y}(\mathrm{s})$ to form 1 mole of $\mathrm{Z}(\mathrm{g})$.
Average rate of consumption of $X(g)$ in the first 10 minutes
$=2 \times 0.038 \mathrm{~mol} \mathrm{dm}^{-3} \mathrm{~min}^{-1}$
$=0.076 \mathrm{~mol} \mathrm{dm}^{-3} \mathrm{~min}^{-1}$ (1)

## Unit Exerc ise (p.24)

17 The decomposition of dinitrogen pentoxide in a suitable solvent produces nitrogen dioxide, which remains in solution, and oxygen gas which is given off. The equation for the reaction is shown below:

$$
2 \mathrm{~N}_{2} \mathrm{O}_{5} \text { (in solvent) } \rightarrow 4 \mathrm{NO}_{2} \text { (in solvent) }+\mathrm{O}_{2}(\mathrm{~g})
$$

a) Draw a labelled diagram of the experimental set-up you would use to follow the progress of this reaction and give the measurement you would make.

Any one of the following:

- Gas collection

Measurements: volume of gas and time

- Mass loss

Measurements: mass loss and time

- Colour change

Measurements: absorbance and time

## Unit Exerc ise (p.24)

b) A sample of dinitrogen pentoxide in a suitable solvent is allowed to decompose. The curve below shows how the concentration of dinitrogen pentoxide varies with time. The dotted line is the tangent to the curve at the start of the decomposition.

## Unit Exerc ise (p.24)

## Calculate

i) the average rate of decomposition in the first 300 s ;

Average rate of decomposition of $\mathrm{N}_{2} \mathrm{O}_{5}$ in the first 300 s
$=\frac{(0.012-0.020) \mathrm{mol} \mathrm{dm}}{}{ }^{-3}-2.7 \times 10^{-5} \mathrm{~mol} \mathrm{dm}^{-3} \mathrm{~s}^{-1}$
ii) the initial rate of consumption of dinitrogen pentoxide.

Initital rate of consumption of $\mathrm{N}_{2} \mathrm{O}_{5}$

$$
\begin{equation*}
=\frac{(0.0092-0.020) \mathrm{mol} \mathrm{dm}^{-3}}{275 \mathrm{~s}}=3.9 \times 10^{-5} \mathrm{~mol} \mathrm{dm}^{-3} \mathrm{~s}^{-1} \tag{1}
\end{equation*}
$$

## Unit Exercise (p.24)

18 Potassium peroxodisulphate $\left(\mathrm{K}_{2} \mathrm{~S}_{2} \mathrm{O}_{8}\right)$ is made by the electrolysis of a saturated solution of potassium hydrogensulphate.
Peroxodisulphate ions oxidise iodide ions according to the equation below:

$$
\mathrm{S}_{2} \mathrm{O}_{8}{ }^{2-}(\mathrm{aq})+2 \mathrm{I}^{-}(\mathrm{aq}) \rightarrow 2 \mathrm{SO}_{4}{ }^{2-}(\mathrm{aq})+\mathrm{I}_{2}(\mathrm{aq})
$$

A colorimeter was used to follow the change in concentration of iodine in the reaction mixture. The absorbance readings were converted to iodine concentrations.
a) Explain why a colorimeter could be used in this experiment.
$\mathrm{I}_{2}(\mathrm{aq})$ has a brown colour.
As the reaction proceeds, the reaction mixture changes from colourless to brown due to $I_{2}(a q)$ formation. (1)
b) Suggest how the initial rate of formation of iodine can be determined from a concentration-time graph.
Determine the slope of the tangent to the curve at time = 0. (1)

## Unit Exerc ise (p.24)

19 Sodium thiosulphate solution reacts slowly with dilute hydrochloric acid to form a precipitate. The chemical kinetics of this reaction can be studied by measuring the time $(t)$ it takes for a small fixed amount of precipitate to form under different conditions.
a) Write an equation for the reaction between sodium thiosulphate solution and dilute hydrochloric acid.

$$
\begin{equation*}
\mathrm{Na}_{2} \mathrm{~S}_{2} \mathrm{O}_{3}(\mathrm{aq})+2 \mathrm{HCl}(\mathrm{aq}) \rightarrow 2 \mathrm{NaCl}(\mathrm{aq})+\mathrm{SO}_{2}(\mathrm{aq})+\mathrm{S}(\mathrm{~s})+\mathrm{H}_{2} \mathrm{O}(\mathrm{I}) \tag{1}
\end{equation*}
$$

b) Identify the product of this reaction which forms the precipitate.

Sulphur (1)

## Unit 36 An introduction to rate of reaction

## Unit Exerc ise (p.24)

c) You are provided with common laboratory apparatus. Describe how you could measure the time $(t)$ taken for a small fixed amount of precipitate to form.
Measure the time for the cross to become invisible when viewed from above the flask. (1)
Draw a labelled diagram of the experimental set-up you would use.

J ${ }^{\prime} K$
Jing Kung Educational Press All Rights Reserved

## Unit Exerc ise (p.24)

d) The turbidity of the reaction mixture increases as the reaction proceeds.

The amount of light that can pass through the reaction mixture (i.e. the light transmittance) gets less.
A technician studied the chemical kinetics of this reaction by using a light sensor connected to a data-logger interface and a computer. Give ONE advantage of using a data-logger with a light sensor.

Continous readings / graph of light transmittance of reaction mixture against time plotted automatically. (1)

## Unit Exerc ise (p.24)

20 An experiment was designed to investigate the rate at which a certain brand of fizzy drink tablet, which contained sodium hydrogencarbonate, dissolved in water at $25^{\circ} \mathrm{C}$. Carbon dioxide was released in the experiment. The set-up shown below was used.

## Unit Exerc ise (p.24)

The graph below shows the results obtained in the experiment.

## Unit Exercise (p.24)

a) Explain why effervescence occurs when a fizzy drink tablet is added to water. Write the ionic equation for the reaction involved.

The fizzy drink tablet contains a solid acid and sodium hydrogencarbonate. The solid acid gives hydrogen ions when dissolved in water. (1) The hydrogen ions react with sodium hydrogencarbonate to give carbon dioxide gas. This gives rise to the effervescence that occurs. (1)
$\mathrm{HCO}_{3}{ }^{-}(\mathrm{aq})+\mathrm{H}^{+}(\mathrm{aq}) \rightarrow \mathrm{CO}_{2}(\mathrm{~g})+\mathrm{H}_{2} \mathrm{O}(\mathrm{I})(1)$

## Unit Exercise (p.24)

b) The mass of sodium hydrogencarbonate in one fizzy drink tablet was
1.25 g . What was the mass of carbon dioxide given off?
(Relative atomic masses: $\mathrm{H}=1.0, \mathrm{C}=12.0, \mathrm{O}=16.0, \mathrm{Na}=23.0$ )
Number of moles of $\begin{aligned} \mathrm{NaHCO}_{3} \text { in one tablet } & =\frac{1.25 \mathrm{~g}}{84.0 \mathrm{~g} \mathrm{~mol}^{-1}} \\ & =0.0149 \mathrm{~mol}^{(1)}\end{aligned}$
According to the equation, 1 mole of $\mathrm{NaHCO}_{3}$ gives 1 mole of $\mathrm{CO}_{2}$.
i.e. number of moles of $\mathrm{CO}_{2}$ given off from one tablet $=0.0149 \mathrm{~mol}$

$$
\begin{align*}
\therefore \text { mass of } \mathrm{CO}_{2} \text { given off } & =0.0149 \mathrm{~mol} \times 44.0 \mathrm{~g} \mathrm{~mol}^{-1} \\
& =0.656 \mathrm{~g} \tag{1}
\end{align*}
$$

c) Suggest ONE advantage of using a data-logger in this experiment.

As the change in mass is very small in this experiment, the use of data-logger can give more accurate results. (1)

## Unit Exerc ise (p.24)

21 The kinetics of the fast reaction below were investigated in a series of experiments.
catalyst $X$

$$
\mathrm{A}+\mathrm{B} \quad \rightarrow \quad \mathrm{C}+\mathrm{D} \quad \Delta H \text { is negative }
$$

Outline a titrimetric method that could be used to measure the change in concentration of compound A with time.
Compound $A$ is an alkali, whereas compounds B, C and D are neutral. (Edexcel Advanced GCE, Unit 4, Jun. 2015, 14(a))

Take samples of known volume at regular time intervals. (1) Quench the reactions by cooling in ice / removing the catalyst. (1) Titrate each sample with a standard acid. (1)
